Why is this paper important for public officials?

Property taxes, the mere mention of which causes blood to boil in New Jersey, are difficult to dissect for the average citizen. Why are they higher in some towns and lower in others? Is there a way to control their growth? How do we know if they are too high?

Municipal officials struggle to define and predict the variation between towns. In many forums, the issues of controlling the rise of property taxes and alternative government funding models are debated time and again.

Property Tax Burden Index and Determinants

This paper proposes a model for a Property Tax Burden Index – a tool measuring the determinants of the variation. Property Tax Burden here is defined as the level of the tax in relation to the financial resources from which it must be paid.

Dr. Ernest Reock Jr. first introduced the concept for the Property Tax Burden Index in 2004. This paper updates those findings and defines the significant changes from the original model. The Index can be used to inform policy decisions – perhaps challenging the current thinking that municipal cost cutting alone will result in reduced property tax burdens in the most burdened places.

Property tax burden may have multiple causes; the model proposes twelve primary determinants

- | | |
|---|--------------------------------------|
| 1. Low level of property tax base | 7. High level of school costs |
| 2. Low level of personal income | 8. High level of county taxes |
| 3. High level of residential property | 9. High level of school enrollment |
| 4. Low level of other municipal revenue | 10. Low level of State municipal aid |
| 5. Low level of other school revenue | 11. Low level of State school aid |
| 6. High level of municipal budget | 12. Low level of State tax rebates |

As the list of determinates in the model suggests, no one item can be used to predict the tax burden.

The heaviest property tax burdens are found in small, older suburbs that have low property tax bases and limited personal incomes among their residents; excessive spending is rarely found in such places, and the only feasible relief must come from outside the community. State school aid is of considerable help in many places, especially in urban communities. However, State municipal aid is insufficient and poorly distributed, having been dramatically reduced or eliminated from many towns. State tax rebates do not redress the balance. The Great Recession of 2008 also contributed to the property tax burden as the value of homes decreased.

Using data to understand

This paper is an example of how the use of data available to everyone can inform our understanding of property tax burdens in New Jersey. The model relies on data reported by state agencies and attempts an unbiased analysis.

Building a model of the determinants of property tax burdens – which vary by municipality – can help the public understand the variation in property taxes. The data used in the model is drawn largely from research for the *New Jersey Legislative District Data Book*, a comprehensive data source published annually by the Center for Government Services at Rutgers.

There is evidence from this model to predict the future, even though this paper relies on the last year that personal income and other tax data was available (2008). As more current data becomes available, it can be used in the model. Local officials can prepare a Property Tax Burden Profile for their own municipality by using the model embedded in this paper. We encourage the use.

Determinants of Property Tax Burden in New Jersey – 2008

Ernest C. Reock, Jr.

Executive Summary

This is an up-date of a paper on the same subject for the year 2004. New data have been gathered and reported, and significant changes have been made in the approach followed.

The purposes of the paper are:

- (1) to suggest a method for measuring the property tax burden in New Jersey municipalities,
- (2) to identify statewide changes in the property tax that took place between 2004 and 2008,
- (3) to apply the suggested method to New Jersey municipalities in order to determine those with the greatest and least tax burden, and
- (4) to continue an exploration of the reasons why variation in burden exists.

The tax burden in any municipality can be measured in two ways: by the equalized net tax rate, which applies to all kinds of property, and by the percentage that the tax takes of the personal income of the residents of the community. A “property tax burden index” is calculated for each municipality, defined as the square root of the product of these two measures. This gives equal weight to each measure in an index that varies proportionately with changes in both measures and permits use of the measure for longitudinal comparisons.

While property taxes are high in New Jersey and were growing annually in the mid-2000’s, their burden was declining as a booming economy brought rapidly rising property values and personal incomes. In 2007, both the equalized net tax rate and the property tax as a percentage of personal income hit their lowest point in New Jersey for many years. However, in the years after 2005, the state, and the nation, began to enter a severe recession. The growth in property values and personal income slowed and then began to reverse. By 2008, both the equalized net tax rate and the percentage that property taxes took from personal income were on the rise, although by that date they had not yet reached the level of earlier years.

The relative property tax burden indexes for New Jersey’s municipalities show wide variations in 2008, as they did in 2004. While a few of the major North Jersey suburbs are among the most heavily burdened, the most frequently impacted places are small, older suburbs, especially in Camden County. Urban areas are less often among the places with the highest property tax burdens. In fact, property taxes in urban communities declined rapidly between 1997 and 2005 as additional State school aid ordered under the Abbott court decision enabled urban school districts to avoid increases in local school tax levies. By 2007, Newark and Jersey City had total equalized net property tax rates – county + municipal + school- rebates – below

the statewide average rate, and in 2008 they ranked #476 and #524, respectively in Property Tax Burden Index. Other urban places made similar, though less spectacular, gains.

Twelve primary “determinants” of property tax burden have been analyzed in four major categories:

Local Financial Resources:

- Amount of taxable property per capita
- Amount of personal income per capita
- Percentage of residential property
- Amount of municipal non-property tax revenue per capita
- Amount of school non-property tax revenue per resident pupil

Expenditures:

- Municipal budget per capita
- School costs per pupil
- County taxes per capita

Demographics

- Percentage of population in public school

State aid:

- State municipal aid per capita
- State school aid per resident pupil
- State tax rebates per capita

With only one exception, the 30 most heavily burdened communities in 2008 have very limited financial resources – taxable property and personal income per capita. Also common among these places are a high percentage of residential property and limited non-property tax revenues.

Excessive public expenditures do not explain the high property taxes in the most burdened communities.. Most of these places spend well below the state average for municipal services. While half of them have above-average school costs, this has been mandated by the Abbott decisions in three of their school systems, and is balanced by high State school aid. The property tax burden from county costs is below the state average in 24 of the 30 most heavily burdened places

The percentage of the population in the public schools is a factor only sporadically, depending upon the nature of the population and the private school facilities available.

State aid for schools and property tax rebates provide some needed support to many of the most burdened places, but State municipal aid is of little help for all but a handful of places.

Procedures and data are presented in the paper to permit any municipality in the state to prepare a Property Tax Burden Profile, indicating the relative impact of each property tax determinant in that community. Profiles are shown for 12 selected places.

The heaviest property tax burdens are found in small, older suburbs that have low property tax bases and limited personal incomes among their residents; excessive spending is rarely found in such places, and the only feasible assistance must come from outside the community. State school aid is of considerable help in many places, especially in urban communities, but State municipal aid is insufficient and poorly distributed, and State tax rebates do not redress the imbalance.

Determinants of Property Tax Burden in New Jersey – 2008
Ernest C. Reock, Jr.

This is an up-date of a paper on the same subject for the year 2004, which was completed and distributed in late 2009. New data have been gathered and reported and some substantial changes have been made in the approach followed; these will be identified in the appropriate locations.

The year 2008 may seem ancient history at this point. However, the availability of personal income information at the municipal level always lags at least two years behind tax information. Here, a decision has been made to use the latest¹ tax and income data for the same period -- 2008 -- , rather than trying to appear more current by combining data for two different years

The Property Tax in New Jersey

New Jersey is recognized as having one of the highest property tax levels in the country. In 2008-09 the state ranked second in property taxes per capita and third in property taxes as a percentage of personal income². Within the state the tax is administered through 566³ separate municipal taxing jurisdictions, and its burden varies widely from place to place. Some communities are heavily burdened by their property taxes; others may be only lightly impacted.

The purposes of this paper are:

- (1) to suggest a method for measuring the property tax burden in New Jersey municipalities,
- (2) to identify statewide changes in the property tax that took place between 2004 and 2008,
- (3) to apply the suggested method to New Jersey municipalities in order to determine those with the greatest tax burden, and
- (4) to explore the reasons why substantial variations in tax burden exist.

A Method for Measuring Property Tax Burden

The Equalized Net Tax Rate –

¹ As of the date this paper was started.

² New Jersey ranked 16th and 34th on personal income taxes, 30th and 43rd on sales and gross receipts taxes, and 5th and 15th on total state and local taxes, respectively. Tax and population data from the U.S.

Bureau of the Census; personal income data from the U.S. Bureau of Labor Statistics.

³ Now (in 2013) 565 with the consolidation of the two Princetons.

Two different ways usually are suggested for calculating the burden of the property tax. The most common approach is to use the property tax rate as an indicator of burden. General property tax rates, under New Jersey constitutional provisions, must be applied uniformly to all taxable properties within a municipal taxing district⁴. Thus, they become a burden on the property in the municipality, usually without regard to its ownership or use⁵. In order to make comparisons among municipalities, corrections must be made wherever possible for variations in tax assessment practices, so that the true value of their taxable property can be gauged by some common measure. The equalized valuation calculated annually by the State Division of Taxation makes such an adjustment and will be used to provide a common basis for measuring a municipality's tax base. The equalized net tax rate used in this paper is the total amount of property taxes levied within the taxing district (municipality) for county, municipal, and school purposes, minus all tax rebates made to residents of the municipality by the State government, divided by the equalized valuation of the taxing district, and multiplied by 100.

The Property Tax as a Percentage of Personal Income –

The equalized property tax rate often is assumed to indicate the burden on the resident taxpayers, and it is in most cases. However, if the taxpayers have very large or very small personal fiscal resources, a high or low equalized property tax rate may not accurately reflect the tax burden borne by the residents of the community. A second method used for measuring property tax burden in a community is the percentage that the property tax levy paid by the residents of a municipality takes from the personal income of the residents.

Property taxes paid by commercial, industrial and non-homestead farm property relieve the tax burden of a community's residents. In order to find the portion of the total tax levy paid by the residents of a municipality, either directly or through their rent, the total levy first has been multiplied by the percentage of the total assessed valuation of the taxing district that is classified as residential, apartment, or farm residence property. This gives the amount of the total tax levy paid on residential property.

A second adjustment then is made to eliminate taxes paid on residential property used only on a seasonal basis by non-residents. This is particularly important in New Jersey's seashore resort communities. In order to calculate the portion of the tax levy paid by residents, the tax levy paid on residential property has been multiplied by the percentage of dwelling units found by the Bureau of the Census to be occupied on April 1, 2010, a date well prior to summer rentals.

Next, the tax levy paid by residents has been reduced by subtracting the amount of State tax rebates paid to residents of the community. The net result then has been divided by the total amount of personal income reported by the Division of Taxation for income tax-paying residents (including their dependents) of the community to find an estimated percentage that the net property tax forms of the personal income of the residents.

⁴ Constitution of New Jersey, Article VIII, Section 1, paragraph 1.

⁵ Other provisions of the Constitution authorize exemptions from taxation for certain specified uses of property, but differential valuations or tax rates are not permitted.

An Index of Property Tax Burden –

The analysis must face the problem of reconciling in a single index number two different measures of property tax burden – the tax rate and the tax as a percentage of personal income --, which may be considered equally important, but are quite different in magnitude. Tax rates in recent years in New Jersey have averaged from about 1.5 to 2.5% of equalized value property. During the same period, property taxes have averaged from about 7.5 to about 9.0% of resident personal income. Simply adding or averaging the two percentages to obtain an index number would give much greater weight to the personal income factor. Three goals have been sought in developing the property tax burden index:

- (1) in the absence of any rationale for preferring one measure over the other, the two measures should be given equal weight in the index.

In the earlier paper, this was done by considering each measure – the equalized property tax rate and the property tax as a percentage of personal income -- as a percentage of the comparable state average figure for the tax year in question. The two percentages of the state average then were averaged to present a single figure that gave them equal weight in an Index of relative property tax burden.

While this produced a balanced measure of relative property tax burden for a particular community in a particular year, it did not lend itself to any meaningful measurement of changing tax burdens over a period of time.

- (2) the index should lend itself to measuring tax burden over a period of time.

An approach to these two criteria might be sought by multiplying the tax rate by the taxes as a percentage of income. This approach gives equal weight to each measure and lends itself to calculations of burden both in a given year and over time.

However, multiplication leads to non-linear results; for example, a 10% increase in the tax rate and in the percentage of income leads to a 21% increase in the index

- (3) the index should give linear results. Therefore the index that has been used is:

The square root of the product of the tax rate and the tax as a percentage of personal income.

This calculation of the index meets all three of the goals stated.

Statewide Trends: 2004 to 2008

In 2004, New Jersey was in the midst of a boom in property valuations. Equalized valuations rose over 14% in that year, while the total property tax levy increased only 6.5% and homestead tax rebates were increased by almost a billion dollars (See Table 1). The result was a significant decline in the state average equalized net property tax rate.

The growth of valuations continued for two more years, with rebates remaining relatively constant. By 2007, the real estate bubble had begun to deflate. Equalized valuations grew only 6.8% in that year. However, the annual increase in property taxes also slackened, an increased homestead tax rebate program helped provide cover for the weakening economy, and the statewide equalized tax rate continued to decline, reaching its lowest point since equalized valuation was invented in the 1950's.

Table 1. Changes in New Jersey Statewide Equalized Net Property Tax Rate, 2003 to 2008.

| | Total Property Tax Levy (Billions) | Annual Percent Change in Total Tax Levy | Homestead Tax Rebates (Billions) | Net Property Tax Levy (Billions) | Equalized Valuation (Billions) | Annual Percent Change in Equalized Valuation | Equalized Net Tax Rate |
|------|--|---|---|--|--------------------------------------|--|------------------------------|
| 2003 | 17.3 | | - 0.8 | 16.5 | 824 | | 2.00 |
| 2004 | 18.4 | + 6.5 | - 1.6 | 16.8 | 940 | + 14.1 | 1.79 |
| 2005 | 19.6 | + 6.5 | - 1.2 | 18.4 | 1,084 | + 15.3 | 1.70 |
| 2006 | 20.9 | + 6.9 | - 1.1 | 19.8 | 1,240 | + 14.4 | 1.60 |
| 2007 | 22.1 | + 5.8 | - 2.2 | 19.9 | 1,324 | + 6.8 | 1.51 |
| 2008 | 23.2 | + 4.9 | - 1.8 | 21.4 | 1,360 | + 1.9 | 1.57 |

Sources: All tax levy data in this paper are from county abstracts of ratables reported on the New Jersey Division of Local Government Services (DLGS) website. Homestead Rebate data provided by the New Jersey Department of Treasury for use in the [New Jersey Legislative District Data Book](#). All equalized valuation data in this paper are annual calendar year figures from the DLGS website...

By 2008, New Jersey and the entire nation were moving rapidly into recession. Although growth in the total property tax levy continued to slow down, property values increased only marginally and, at the same time, homestead tax rebates were cut back. The result was that the trend of the equalized net property tax rate reversed in 2008, and New Jersey began to enter a period of increasing net property tax rates.

Personal income also was on the rise in 2004 (See Table 2), an 8.4% annual growth combining with the 6.5% increase in the property tax levy and the expansion of the homestead tax rebate program to produce a decline in property taxes as a percentage of income from 5.19% a year earlier to 4.86%.

New Jersey personal income continued to grow through the 2007 income tax year, in fact at an accelerating pace. In that year, property taxes took only 4.54% of New Jersey taxpayers' personal income.

In 2008, however, the bottom dropped out of the economy and the personal income of New Jersey income taxpayers changed from a 10.3% annual increase in 2007 to a 2.9% decrease in the next year. With homestead tax rebates also being reduced, property taxes as a percentage of personal income rose to 4.95%.

Table 2. Changes in the New Jersey Net Property Tax as a Percentage of the Personal Income of Residents, 2003 to 2008

| | Total Property Tax Levy (Billions) | Annual Percent Change in Total Tax Levy | Home- Stead tax Rebates (Billions) | Net Property Tax Levy Billions) | Total Personal Income (Millions) | Annual Percent Change In Personal Income | Percent of Net Property Tax Levy Paid by Residents | Net Property Tax Paid by Residents (Billions) | Net Property Tax as Percent of Personal Income |
|------|--|---|--|---|---|---|---|--|--|
| 2003 | 17.3 | | - 0.8 | 16.5 | 220.8 | | 66.4 | 11.5 | 5.19% |
| 2004 | 18.4 | + 6.5 | - 1.6 | 16.8 | 239.4 | + 8.4 | 63.3 | 11.6 | 4.86 |
| 2005 | 19.6 | + 6.5 | - 1.2 | 18.4 | 260.5 | + 8.8 | 66.2 | 13.0 | 4.98 |

| 2007 | 22.1 | + 5.8 | - 2.2 | 19.9 | 308.2 | + 10.3 | 63.3 | 14.0 | 4.54 |
| 2008 | 23.2 | + 4.9 | - 1.8 | 21.4 | 299.1 | - 2.9 | 63.9 | 14.8 | 4.95 |

Sources: As in Table 1, plus

All Personal Income data in this paper are from New Jersey Department of Treasury for use in the New Jersey Legislative District Data Book.

When the equalized tax rate data from Table 1 are combined with the information on property taxes as a percentage of personal income in Table 2, a Property Tax Burden Index for the entire state can be constructed, as shown in Table 3. New Jersey's state Property Tax Burden Index declined steadily from 2003 through 2007 and then, as the recession gathered strength, it began to rise in 2008.

Table 3. Changes in the New Jersey Property Tax Burden Index, 2003 to 2008

| | State Average Equalized Net Property Tax Rate | Net Property Tax As Percent of Personal Income | State Property Tax Burden Index |
|------|--|---|---|
| 2003 | 2.00 | 5.19% | 3.22 |
| 2004 | 1.79 | 4.86 | 2.95 |
| 2005 | 1.70 | 4.98 | 2.91 |
| 2006 | 1.60 | 5.04 | 2.84 |
| 2007 | 1.51 | 4.54 | 2.62 |
| 2008 | 1.57 | 4.95 | 2.79 |

Application to New Jersey Municipalities

The procedures described above have been applied to all New Jersey municipalities with the exception of a few that are so small, or their ownership patterns so specialized, that the data may be unreliable⁶. Table 4 shows the Relative Property Tax Burden Index for the 30 most heavily burdened municipalities using 2008 data, with communities listed in descending order of burden⁷.

The two components of the Property Tax Burden Index -- equalized net property tax rate and net taxes as a percentage of personal income -- generally work in tandem; when one measure is high the other usually is high also. However, there are exceptions. Many seashore resorts -- Cape May, Harvey Cedars, Surf City, Bay Head, --have very low property tax rates, but those property taxes impose well above the state average burden on the personal incomes of their year-round residents. In contrast, some of the poorer communities of the state -- Bridgeton, Hi-Nella, Trenton, Camden -- show the reverse pattern: a low burden on personal income, but very high tax rates.

Seventeen of the most heavily tax-burdened municipalities in 2008 also were among the 30 most heavily burdened in 2004, including eight of the top ten. New Jersey's large cities are conspicuously absent from this list. Only East Orange, Irvington, West Orange, and the City of Orange Township among New Jersey's 100 largest municipalities, appear on the list of the 30 most heavily burdened by the property tax. Instead, the typical high tax-burden place is a small

⁶ Teterboro, Audubon Park, Pine Valley, Tavistock, Walpack and Winfield. Audubon Park was included in the 2004 analysis, but more recent reports appear unreliable.

⁷ The Property Tax Burden Index for all municipalities, in alphabetical order by county, is shown in Appendix Table 1.

most heavily burdened by the property tax. Instead, the typical high tax-burden place is a small suburban community. Thirteen counties have at least one community among the most heavily burdened, with Camden the leader at nine.

Table 4. Property Tax Burden Index – 30 Most Heavily Burdened New Jersey Municipalities, 2008.

| Index Rank | Municipality | County | Equalized Net Tax Rate | Net Tax as % of Personal Income | Property Tax Burden Index |

Determinants of Property Tax Burden

Property tax burden may have multiple causes, including limited local resources, high levels of expenditures, below-average assistance from State government, and even some elements of local demographics. Table 5 shows a classification of the primary determinants that have been examined, together with commonly used scales for measuring the level of each determinant.

Table 5. Determinants of Property Tax Burden.

| Nature of Determinant | | Primary Determinant | Measurement Scale |
|---------------------------|----|---------------------------------------|--|
| Local Financial Resources | 1 | Low level of property tax base | Equalized valuation per capita |
| | 2 | Low level of personal income | Personal income per taxpayer plus dependents. |
| | 3 | High level of residential property. | Percentage of residential property |
| | 4 | Low level of other municipal revenue. | Local municipal miscellaneous revenue per capita |
| | 5 | Low level of other school revenue | Budgeted school surplus per resident pupil. |
| Expenditures | 6 | High level of municipal budget. | Municipal budget per capita |
| | 7 | High level of school costs | School costs per resident pupil |
| | 8 | High level of county taxes | County tax levy per capita |
| Demographics | 9 | High level of school enrollment | Resident school enrollment as percentage of total population |
| State Aid | 10 | Low level of State municipal aid | State municipal aid per capita |
| | 11 | Low level of State school aid | State aid to schools per resident pupil |
| | 12 | Low level of State tax rebates | State tax rebates per capita |

Only “primary” determinants have been considered here; that is, the determinants having a direct impact on the property tax. For example, a high municipal budget per capita is considered a

primary determinant of property tax burden. However, a low tax collection rate, which would trigger a high reserve for uncollected taxes, causing a larger municipal budget per capita, would be considered a “secondary” determinant of property tax distress. Secondary determinants are not within the scope of this paper.

Special Data Treatment

“Expanded” Population Data Many of the determinants are measured on a per-capita basis—equalized valuation, municipal non-property tax revenue, municipal budgets, county taxes, state municipal aid, and tax rebates⁸. In order to compensate particularly for the special conditions in the seashore resorts – large non-resident summer populations and low year-round occupancy – the estimated resident population of every municipality has been divided by the percentage (expressed as a decimal) of dwelling units found by the Bureau of the Census to be occupied on April 1, 2010. The result is called the “expanded” population figure, which may more reasonably represent the total number of persons for whom services must be provided. Thus, for example, Sea Isle City, with an estimated 2008 resident population of 2,909, and with only 15.1% of its dwelling units occupied on April 1, 2010, is treated as though it had a year-round population of 19,265 persons. The same calculation has been made for every municipality in the state, although the impact is on a much smaller scale in non-resort places. The resulting “expanded” state population is +10.3% higher than the official 2008 state population estimates.

School Data Two problems are encountered in combining the financial data of school districts and municipalities. One is that the geographic jurisdictions of the units do not always coincide. Where there is a school district that offers a full K-12 curriculum or where the school district operates only a K-6 or K-8 system and sends its high school students to another district on a tuition basis, there is no special problem because all resident students will be counted in the home district coinciding with the municipality, and all of their costs will be in the local school budget. However, where there are regional or consolidated school districts that cover more than one municipality, special steps are necessary. Public school enrollment data have been aggregated by municipality, using information supplied by the New Jersey Department of Education on the municipal origin of students enrolled in regional and consolidated school districts. However, the financial data of the regional school districts -- budgets, budgeted school surplus, and state aid – have been apportioned among the constituent municipalities in each case on whatever basis has been used by the school boards and the county boards of taxation in apportioning the tax levies of the regional districts. These bases vary – sometimes in proportion to tax ratables, sometimes to resident enrollment, and sometimes a combination of the two. School financial data – budgets, budgeted school surplus, State aid – have been presented on a per pupil basis, primarily because this is the most commonly used and understood terminology. Part of the school data – State aid and school surplus -- are for the 2008-09 school year, resulting in some disconnect when combined with tax and other data presented on a 2008 calendar or tax year basis.

⁸ Presentation of data on a household basis, rather than per capita, has been considered but rejected in favor of the more common per capita measure.

The second problem is that the fiscal years of the school districts and the municipalities do not coincide. Whereas the property tax is levied on a calendar year basis, school data, including state aid, is available only on a hyphenated school year basis. No neat solution is apparent. Therefore, school district financial data for 2008-09 has been combined with municipal data for 2008, and the term school “costs”, rather than school “budgets”, has been used.

Income Data Personal income data have been presented on the basis of the total number of individual State income tax taxpayers and their dependents, as reported by the Division of Taxation, thus approximating a per capita basis⁹. This obviously results in an undercount of population and income where there are persons below the tax-paying threshold. In 2008 the total number of income taxpayers and their dependents comprised 91% of the total estimated population and 82% of the “expanded” population described above.

Comparison to State Averages

Each primary determinant has been measured by the scale indicated in Table 5. The data for a municipality then have been expressed in Table 6 as percentages of the state average for each determinant. For example, the equalized valuation for Woodlynne (#1)-- \$35,924 per capita – is only 25.3% of the state average of \$141,968. Shading in Table 6 highlights percentages above or below the state average, indicating that these particular determinants contribute unusually to the community’s property tax burden. Percentages of a determinant that reduce, rather than increase, the property tax burden are shown unshaded. For example, the equalized valuation per capita of West Orange (#7) is above the state average, so it is shown unshaded.

The 30 Most Heavily-Burdened Municipalities

Local Financial Resources

Five primary financial resource determinants have a significant effect on the level of property tax burden and are considered here – the property tax base, the personal income of the residents, the proportion of taxable residential property, the amount of non-property tax revenue received by the municipality, and the amount of surplus used to balance the school district budget.

Determinant #1 - Low Level of Property Tax Base

Probably the most obvious financial resource determinant of property tax burden is a low level of taxable property. For any given tax levy, the smaller the amount of taxable property, the higher the tax rate. The level of the tax base has been measured by the equalized valuation per capita, using expanded population figures..

⁹ Personal income data provided by the State Department of Treasury for use in the New Jersey Legislative District Data Book.

Table 6. Determinants of Property Tax Burden: Percentages of State Averages, 2008; 30 Most Heavily Burdened Municipalities.

| LOCAL FINANCIAL RESOURCES | | | | | | | | | | EXPENDITURES | | | | | | DEMO-GRAFPHICS | | | |

| 26 POHATCONG | 3.87 | 89.8 | 79.6 | 86.5 | 124.7 | 135.0 | 124.5 | 93.8 | 181.6 | 102.0 | 76.2 | 61.2 | 176.2 | | | | | | |
| 27 POMPTON LAKES | 3.87 | 96.3 | 91.3 | 110.6 | 53.9 | 81.7 | 83.7 | 95.2 | 147.6 | 105.1 | 70.8 | 42.8 | 171.6 | | | | | | |
| 28 MOUNT EPHRAIM | 3.86 | 49.1 | 68.3 | 108.2 | 79.5 | 135.9 | 81.6 | 91.5 | 92.8 | 99.2 | 63.7 | 96.9 | 176.0 | | | | | | |
| 29 WASHINGTON BOR. | 3.85 | 56.7 | 68.3 | 101.2 | 63.0 | 162.7 | 72.6 | 83.4 | 97.7 | 103.9 | 59.5 | 80.9 | 112.9 | | | | | | |
| 30 MAGNOLIA | 3.85 | 44.2 | 63.3 | 107.1 | 76.9 | 18.2 | 71.3 | 89.5 | 87.6 | 102.3 | 69.0 | 113.4 | 158.6 | | | | | | |

Table 6 shows the relative 2008 level of the tax base in the 30 most property tax-burdened municipalities, when measured as a percentage of the state average equalized valuation per capita – \$141,968. Low tax bases clearly are a major factor in the most burdened communities. Every one of these places except West Orange (#7) has a property tax base per capita below the state average and, except for Bloomingdale (#22) and Pompton Lakes (#27), more than 10% below.

Determinant #2 - Low Level of Personal Income

The amount of personal income of the community's residents has a direct impact on the second component of the Property Tax Burden Index – the percentage that property taxes take of their personal income. The personal income used here is the total personal income reported by New Jersey income taxpayers. This amount has been divided by the number of taxpayers plus their dependents, with the state average in 2008 being \$38,024 per capita.

Two factors in the 2004 report made the municipal figure artificially low in some cases. First, in that year the data did not include social security payments, so figures for senior citizen communities and other concentrations of the elderly were artificially low. This omission was corrected by 2008, and the data for these communities should be more accurate for this year. The second factor still is reflected in the data; this is that communities having large numbers of very low income persons, who are below the taxpaying threshold for the New Jersey income tax, will show less total personal income than actually exists in such places. However, the income missed by this approach probably is relatively small on a per capita basis. All data are from the State Department of the Treasury.

Among the 30 most distressed municipalities, 26 have levels of personal income per taxpayer considerably below the state average, with three, High Bridge (#11) and Bloomingdale (#22), and Pompton Lakes (#27) being below, but nearer to, the average. Again, West Orange (#7) is the only high-burden place having an average personal income per taxpayer greater than the state average.

Determinant #3 –High Level of Residential Property

The property tax burden on the residents of a municipality can be ameliorated by the presence of large amounts of commercial or industrial property that will carry a portion of the tax levy. Conversely, where a community is almost entirely residential, nearly the full load of property taxation must be borne by the residents. Determinant #3 measures the proportion of residential property¹⁰ in the municipality, using the classifications of property applied by the local tax assessor each year when participating in the sales ratio program administered and reported by the State Division of Taxation. Data come from the website of the State Division of Local Government Services in the Department of Community Affairs. Statewide, the percentage of residential property for 2008 is 79.4%

¹⁰ “Residential property” used here includes properties classified as residential, apartment and farm residential, in contrast to commercial, industrial, and farm property (other than farm homesteads).

Of the 30 places with the highest Property Tax Burden Indexes, 21 have above-average proportions of residential property. In contrast, some municipalities that have relatively small property tax bases per capita and low average personal incomes, may be saved from even heavier property tax burdens by substantial amounts of non-residential property.

Determinant #4 - Low Level of Other Miscellaneous Revenue

The fourth financial resource determinant of property tax burden is the relative absence of non-property tax revenues at the local municipal level. Large amounts of non-property tax revenue can relieve local officials of the necessity for levying substantial property taxes. Examples include payments in lieu of taxes (pilots), license fees, municipal court fines, parking meter revenues, special tax revenues in some places, surplus, delinquent taxes, and a multitude of other sources of local government revenue. Determinant #4 has been measured by the level of municipal miscellaneous revenue shown in Column 14d of the county abstract of ratables, with State aid revenues being deducted. The resulting local miscellaneous revenue has been divided by the expanded population to obtain a per capita figure. The state average in 2008 is \$412 dollars per capita¹¹.

Below-average levels of local municipal miscellaneous revenue are common among the high property tax burden communities. Twenty-two of the 30 highest burden municipalities, including all four of the highest burden places, have less than the average amount of non-property-tax local revenue. Communities with large concentrations of residential property – Woodlynne (#1), Laurel Springs (#8), Lindenwold (#10), Bloomingdale (#22), Willingboro (#25), and Pompton Lakes (#27) – often have low levels of local municipal miscellaneous revenue, although this combination is not universal.

Determinant #5 - Low Level of School Surplus¹²

The final fiscal resource determinant examined here is the amount of the school district's general fund balance that was used in 2008-09 to help balance the school budget. In past years, many school districts were able to build up substantial surpluses that could be drawn upon to help stabilize the property tax rate from year to year. These surpluses have dwindled in recent years under pressure both from taxpayers and from the State Department of Education. Nevertheless, they still constitute an important resource that helps reduce the tax burden in some school districts. On average, across that state, such funds amount to \$458 per resident pupil in 2008-09. However, they vary widely from municipality to municipality, reflecting sporadic use. Among the 30 most burdened municipalities, budgeted school surplus is below the state average in 19 places, with no discernible pattern among the communities.

¹¹ Expanded population.

¹² In 2004, this Determinant also included school district miscellaneous revenue, amounting to about \$67 per resident pupil statewide. Data on this item were not readily available for 2008, and it has been omitted from this report.

Data for budgeted school surplus have been derived from Indicator 20 in the 2010 Comparative Spending Guide issued by the New Jersey Department of Education.

Summary of Financial Resource Determinants

While the distribution of the five financial resource determinants varies from place to place, the lack of such resources remains a predominant reason for high property tax burden in most of the worst-off communities. Although only nine of the 30 most burdened municipalities are below average on every financial resource determinant, thirteen are below average on four resource determinants, and all of them except Pohatcong (#26) fall short on at least three of the five measures.

Expenditures

Three primary expenditure determinants of property tax burden have been evaluated in each municipality. These are the municipal budget per capita, the school costs per resident pupil, and the level of county taxes apportioned to the municipality. The results are shown in Table 6 as percentages of the statewide average figure.

Determinant #6 - High Level of Municipal Budget

The level of the municipal budget has an obvious impact on both the tax rate and the property tax as a percentage of personal income. Municipal budget data have been taken from the county abstracts of ratables, and consist of the tax levies for local municipal purposes (Col. 12CII(a)) and for municipal open space (Col. 12CII(b)), plus the total miscellaneous revenue anticipated (Col. 14(d)), minus all State municipal aid¹³. The resulting budget figures have been divided by the estimated expanded 2008 resident population of each municipality to find Determinant #6. The state average municipal budget per capita in 2008 is \$1,247¹⁴.

Eleven of the 30 most burdened municipalities have per capita municipal budgets above the state average. In several cases, they are the more urban places – Orange (#9), East Orange (#13), and Irvington (#24), but some of the older suburbs also are included, such as Roselle (#2), West Orange (#7), Hillside (#5), Haledon (#12), and Ridgefield Park (#21). Less easily explainable are the high municipal budgets in Lawnside (#6), High Bridge (#11), and Pohatcong (#26).

Determinant #7 - High Level of School Costs

School expenditures also impact both the tax rate and the property tax as a percentage of local income. School costs used here are the sum of:

- (1) all State formula aid to school districts;
- (2) the budgeted general fund balance, or school surplus,

¹³ See below, p. 10 for a description of State municipal aid.

¹⁴ Expanded population.

with both items as supplied for 2008-09 for the New Jersey Legislative District Data Book by the State Department of Education and consolidated on a municipal basis; and

- (3) the local district school tax levy (Col.12CI(a));
- (4) the regional and consolidated school district tax levy (Col.12CI(b)); and
- (5) the school tax levy in the municipal budget (Col.12CI(c));

with all three from the 2008 county abstract of ratables.

The term “school costs” is the equivalent of a school budget per pupil in school districts with K-12 fiscal responsibilities. In the constituent municipalities of a K-12 regional or a regional high school district, the per pupil cost is influenced by the apportionment of the regional tax levy among the municipalities.

Finally, the total school cost figure has been divided by the total number of public school pupils from the municipality in all school districts involved. County vocational district expenditures and pupils have been ignored, since costs not included in the budgets of the individual school districts that send pupils to the vocational schools will be included in the county tax levy. The state average school cost per pupil in 2008-09 is \$15,776.

Thirteen municipalities out of the 30 most burdened have school costs per pupil above the state average on Determinant #7. Several of these places – Salem City (#3), Orange (#9), East Orange (#13), and Irvington (#24) – are Abbott school districts, where a high school budget per pupil has been mandated in recent years with compensating State aid to reduce the property tax. Non-Abbott municipalities in the top 30 tax-burden places with above average per-pupil school costs include Roselle (#2), Woodbury (#4), West Orange (#7), Lawnside (#6), Lindenwold (#10), High Bridge (#11), North Plainfield (#16), Bloomingdale (#22), and Willingboro (#25), although many of these places are barely above the state average.

Determinant #8 - High Level of County Taxes

Taxes for county purposes apportioned to the municipalities are identified as Determinant #8. Here the source of information again is the county abstract of ratables, and the data include the net county taxes less municipal state aid (Col. 12AV)¹⁵, county library taxes (Col. 12B(a)), county health taxes (Col. 12B(b)), and county open space taxes (Col.12B(c)). Expanded population figures are used to calculate the per capita data.

The average county tax levy in 2008 is \$458 per capita¹⁶. Only seven of the 30 most burdened places appear to have above-average county taxes. These include West Orange (#7) – a municipality that is reasonably well-to-do in a county with a number of poorer communities, where the more affluent communities often carry much of the county tax load, three smaller

¹⁵ This particular state aid to municipalities is almost extinct. Only Walpack received such aid in 2008, for a total of \$1,523.

¹⁶ Expanded population.

places in Camden County, where county taxes, in general, are high –Lawnside (#6), Laurel Springs (#8), Barrington (#19), and three places – Bloomingdale (#22) and Pohatcong (#26), and Pompton Lakes (#27) – for which there is no ready explanation.

Summary of Expenditure Determinants

High expenditure levels occur much less frequently than low resource levels among the most burdened communities. Some aspect of high expenditures can be blamed, at least partially, for the property tax burden in most of the 30 highest-burden communities. However, in ten places –Woodlynne (#1), Prospect Park (#14), Penns Grove (#15), Stratford (#17), Somerdale (#18), Glassboro (#20), Newton (#23), Mount Ephraim (#28), Washington Borough (#29), and Magnolia (#30) – the property tax burden is substantial even though every expenditure determinant is below the state average. All of these places have such low levels of resources that they are particularly burdened.

Demographics

Determinant #9 – High Level of Public School Enrollment

One demographic determinant of relative property tax burden has been examined – the percentage of a municipality’s population that is enrolled in the public schools. More children in school mean more expenditures.

The percentage of a community enrolled in the public schools is affected by at least four factors: the age make-up of the community, the reputation of the public schools, the availability of non-public schools, either religious or secular, and an income level of the population that would facilitate private school enrollment. Data on resident enrollment was supplied by the New Jersey Department of Education.

Some communities are relatively young, with large numbers of school-age children in proportion to adults. Woodlynne (#1), Prospect Park (#14), and Penns Grove (#15), are the three places with the highest percentages of their population enrolled in public schools. All three have experienced large in-migrations of Hispanic residents with young children. Haledon (#12) also comes close to fitting this pattern, although the overall population growth has been minimal.

Municipalities that have large public school enrollments probably due of the reputation of their schools – Montgomery (#293), Mountain Lakes (#374), and Millburn (#486), for example – are not included in Table 6 because their high property tax resources often permit them to sponsor such schools with moderate property tax burdens.

Areas having a strong parochial school system and tradition, as in Hudson County, have low public school enrollments as a proportion of total population, and also do not appear in Table 6.

Finally, a low personal income of the residents may prevent them from participating in private school education. This is probably a factor in the most burdened communities, such as Woodlynne (#1), Salem City (#3), Prospect Park (#14), and Penns Grove (#15).

State Aid

State aid is provided to local communities in two ways – by grants to municipalities and school districts, and by direct tax rebate payments to qualified taxpayers.

Determinant #10 – Low Level of State Aid to Municipalities

In 2008-09, State aid to municipalities amounts to \$1.611 billion, broken down as follows:

| | |
|--|---------------------|
| 2008 Adjusted CMPTRA..... | \$ 631,110,087 |
| Total Energy Receipts Tax Distribution 08..... | 906,247,396 |
| Garden State Trust CY/08SFY 09..... | 9,827,687 |
| Watershed Moratorium Offset..... | 2,217,648 |
| Pinelands Property Tax Stabilization..... | 1,800,000 |
| Highlands Water Protection and Planning Act..... | <u>108,679</u> |
| Total Adjusted Formula Aid | \$1,611,333,497 |

Aid is apportioned to municipalities by a variety of formulas. When aggregated, in 2008-09 it comes to an average of \$168 per capita¹⁷. Data on State aid to municipalities comes from the website of the Division of Local Government Services in the Department of Community Affairs.

Low per capita levels of State municipal aid are common among the 30 most heavily-burdened municipalities in 2008. Twenty-two of the 30 places shown in Table 5 receive below-average amounts of such assistance per capita. The more urban places – Orange (#9), East Orange (#13), and Irvington (#24) – do reasonably well, as do some smaller urban places. Salem City (#3) and Hillside (#5) receive more aid than the average, as do a handful of other places – Lawnside (#6), Laurel Springs (#8), and Penns Grove (#15) -- but most heavily-burdened places receive much less.

Determinant #11 – Low Level of State Aid to Schools

The earlier report on property tax determinants in 2004 focused on a year in the midst of a “freeze” of State aid for schools that lasted from 2002-03 to 2007-08 for most school districts. State aid to schools totaling \$6.348 billion, was distributed in 2004-05 through a multitude of formulas, most of them included in the Comprehensive Education Improvement and Financing

¹⁷ Expanded population.

Act of 1996 (CEIFA). In addition, special aid for some of the poorest districts was provided in the State budget and grew from year to year to meet the requirements of the Abbott v. Burke court decision.

In January, 2008, the Governor signed into law the School Funding Reform Act of 2008¹⁸, which substantially changed the distribution of State aid to local school districts. All districts were brought within a single package of state aid formulas, although some provisions of the law were designed to hold the “Abbott” districts harmless for the immediate future. Total State aid for schools in 2008-09 rose to \$8.289 billion, or \$6,047 per resident pupil. Data for 2008-09 were provided by the New Jersey Department of Education.

In contrast to the municipal aid formulas, which give little weight to the financial resources of a community, major portions of the State school aid formulas in 2008-09 do recognize the level of both the property tax base of the school district and the personal income of community residents. The result is that only thirteen of the 30 most burdened municipalities receive below-average amounts of State school aid per pupil. The four Abbott communities among the 30 most burdened – Salem City (#3), Orange (#9), East Orange (#13) and Irvington (#24) – receive far above the average State aid per pupil in 2008-09.

While State school aid plays a significant role in relieving the property tax burden in many low-wealth communities, its effect fades quickly for those places that have more substantial local financial resources. Comparatively well-to-do places like West Orange (#7), receive relatively limited property tax relief from State aid to their schools. The impact of aid to the Abbott districts on the state average is so great that a large number of other municipalities fall below the average level. Even more modest places, such as Laurel Springs (#8), High Bridge (#11), Stratford (#17), Barrington (#19), Ridgefield Park (#21), Bloomingdale (#22), Newton (#23), Pohatcong (#26), Pompton Lakes (#27), Mount Ephraim (#28), and Washington Borough (#29) receive less than the State average of \$6,047 per pupil.

Determinant #12 – Low Level of State Tax Rebates

Tax rebates, paid by the State to individual local taxpayers, have been a staple of New Jersey government since 1977¹⁹. While relatively stable for many years, during the early 2000s tax rebates fluctuated considerably. In 2008, a total of \$1.826 billion - \$191 per capita - was distributed under the tax rebate program. The total rebates received in each municipality have been divided by the expanded population of each municipality to find a per capita figure. Data on tax rebates are from the New Jersey Department of Treasury for use in the New Jersey Legislative District Data Book.

Most of the heavily burdened municipalities receive some significant benefit from the tax rebates in 2008. Exceptions are Salem City (#3), Orange (#9), East Orange (#13), Penns Grove (#15), and Irvington (#24) and, to a lesser extent, Woodlynne (#1), Lindenwold (#10), Prospect

¹⁸ C.260, L.2007.

¹⁹ Tax rebates paid directly to taxpayers were replaced in 2011 by tax credits applied to the quarterly tax bill of each qualified taxpayer.

Park (#14) and Glassboro (#20). Most of the places that have below-average tax rebates also have less than the state average percentage of owner-occupied housing²⁰, probably reflecting some bias in the tax rebate laws favoring home ownership over tenancy.

Summary of State Aid Determinants

None of the 30 most property tax-burdened municipalities in the state receive below-average assistance on every form of State aid. In this sense, the State aid programs tend to supplement each other. State aid for schools, of course, dwarfs the other aid programs, distributing more than twice as much money as municipal aid and tax rebates combined. Moreover, school aid is distributed through a dynamic²¹ formula that recognizes both current property values and personal income. Without such a school aid formula, the situation of the most property-tax-burdened communities of the state would be far more desperate.

Summary of Property Tax Burden Determinants

An examination of the distribution of significant determinants among the 30 most-burdened municipalities in Table 6 reveals a heavy concentration of deficiencies in the financial resources area. Many fewer of these most-burdened places appear in the table because of high expenditures. State aid --municipal, school, and rebate -- fails to compensate adequately for the lack of local financial resources in the most heavily-burdened municipalities of the state, resulting in wide variations in burden.

Property Taxes in the Urban Municipalities

The low 2008 Property Tax Burden Index rankings for many urban municipalities, especially Newark (#476) and Jersey City (#524) may come as some surprise, given the common understanding that property taxes are excessive in New Jersey's urban areas (See Table 7). Property tax rates really were high in these places until the late 1990's. Since that time, however, tax rates in the state's two largest cities and in some of the other urban communities have dropped sharply. By 2005, the equalized net property tax rate in Jersey City was below the state average, and in 2007 the same thing happened in Newark (See Chart 1)²². Both cities remained below the state average net property tax rate through 2009. Since that time, property tax rates have rebounded in the two cities, but they are still far below their peaks in 1997-98 and only minimally above the state average²³. Property taxes as a percentage of personal income in

²⁰ New Jersey Legislative District Data Book, 2009, Table A.

²¹ A "dynamic" formula is recalculated every year with current enrollment, equalized valuation and personal income data.

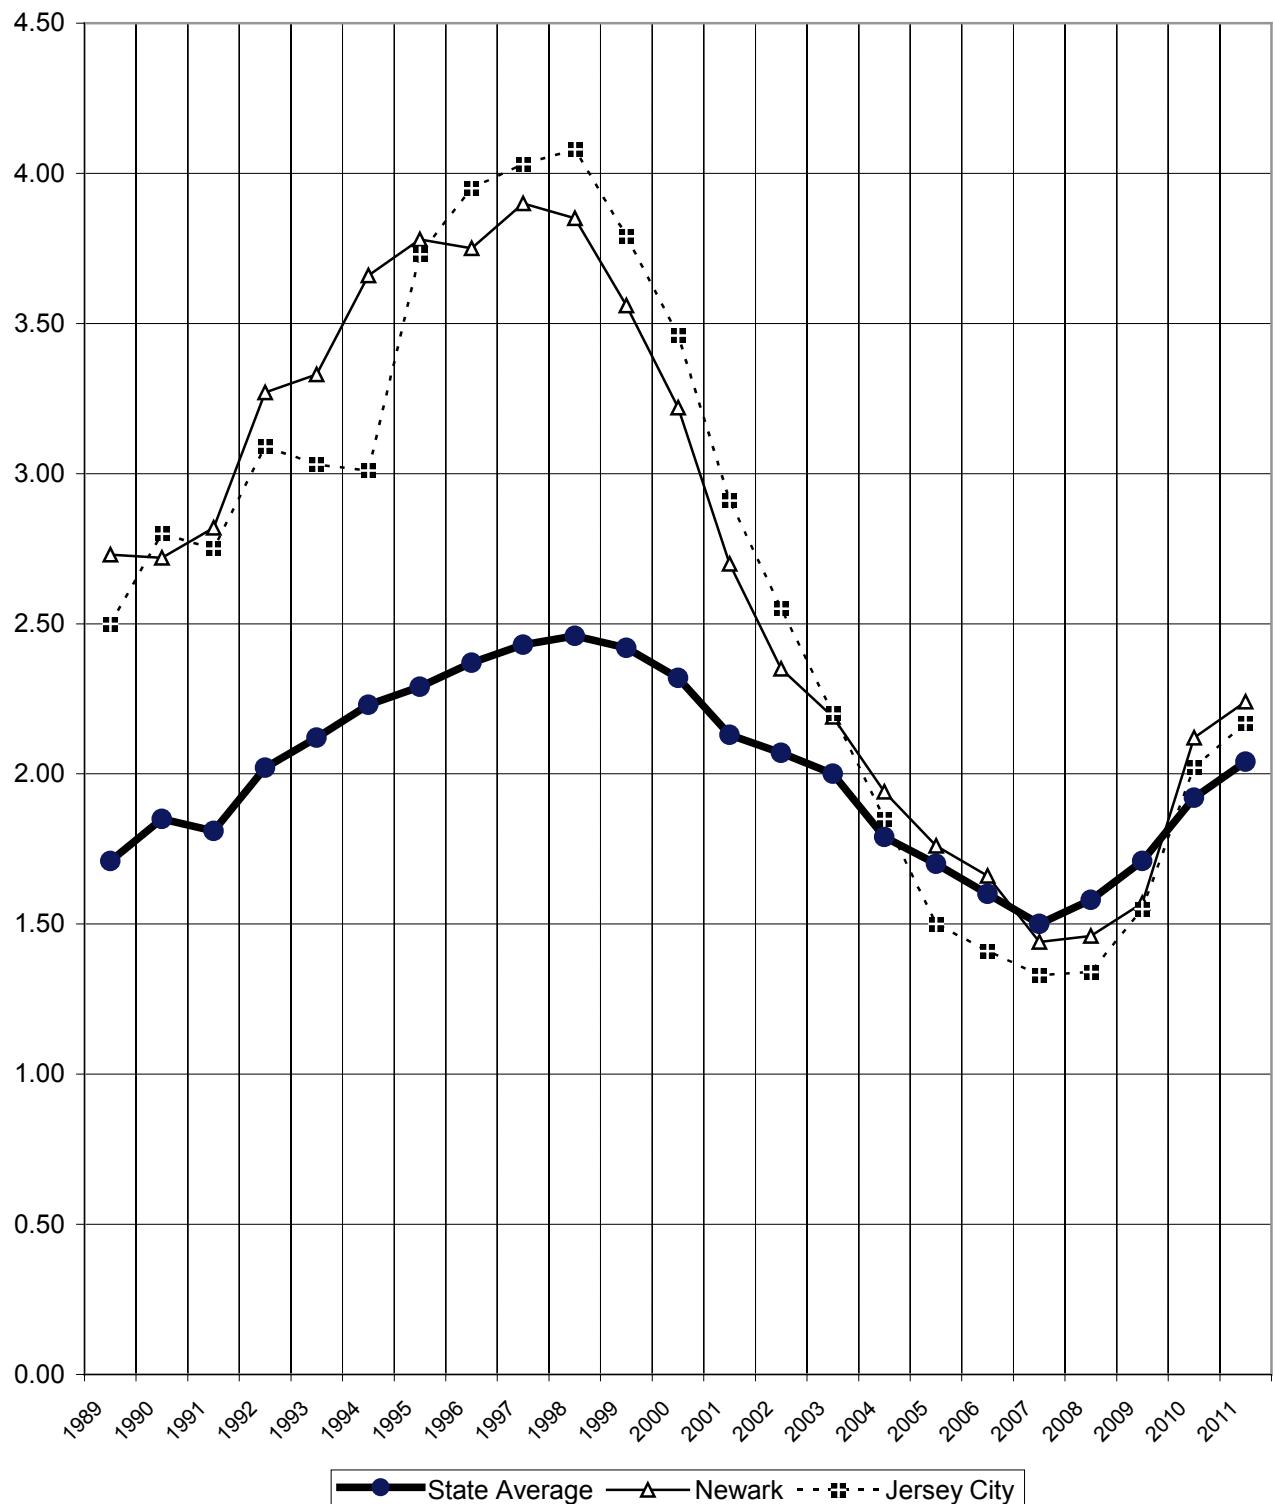

²² New Jersey Legislative District Data Book, years 1989 through 2013.

²³ From this point on this paper will use the Supreme Court's identification of 28 "urban" school districts to define "urban" municipalities. Originally, the Court identified only 28 places. However, subsequent judicial and legislative action soon resulted in the addition of Plainfield and Neptune Township to the 28, and Salem City joined to group in more recent years, for the total of 31 urban municipalities.

Table 7. Property Tax Burden Index – Urban Municipalities, 2008

| Index Rank | Municipality | County | Equalized Net Tax Rate | Net Tax as % of Personal Income | Tax Burden Index |
|------------|-----------------|------------|------------------------|---------------------------------|------------------|
| 3 | Salem City | Salem | 2.55 | 6.80 | 4.40 |

| 525 | Hoboken | Hudson | 1.23 | 3.07 | 1.94 |

**Chart 1: New Jersey Equalized Net Property Tax Rates: 1989-2012;
Newark, Jersey City and State Average**

Newark and Jersey City, first calculated for 2003²⁴, have consistently since that time been below the state average.

Why the change? The major reason is the Abbott v. Burke school funding case. While the first substantive decision in the case occurred in 1990, the remedies ordered immediately required only increased expenditures in the urban districts, with some recognition by the Court that this could cause fiscal burdens for both the State and for local communities and that a phase-in might be appropriate. In fact, the state did increase funding for the schools modestly in 1990 with the Quality Education Act (QEA)²⁵ and then with the Comprehensive Education Improvement and Financing Act in 1996²⁶. Urban property tax rates for county, municipal and school purposes remained high or even increased during the early 1990s.

In 1997, however, the Supreme Court in its Abbott IV decision ordered “that the State provide increased funding to the twenty-eight districts identified...as “Abbott districts” that will assure that each of those districts has the ability to spend an amount per pupil in the school year 1997-98 that is equivalent to the average per-pupil expenditure in the DFG I & J districts ...”²⁷ The Supreme Court order was interpreted initially to require that all additional expenditures must be provided by the State. This interpretation opened up a new era in New Jersey urban property taxation. In 1997-98, all but three of the 31 Abbott school districts²⁸ were able to adopt budgets with substantially the same or smaller school general fund tax levies as in the prior year, while the State provided additional state aid to make up the difference. This practice was continued for a number of years, with most Abbott school districts approving budgets each year having little or no annual increase in tax levy. Newark, for example, levied a school property tax of \$80,000,000 every year from 1996-97 through 2005-06, while its property tax base (equalized valuation) grew by 150%. With even a small annual increase in the amount of taxable property, a fixed tax levy can only result in a lower tax rate. Substantially the same thing happened in Jersey City, and the impact on taxes was accentuated by a building boom; from 1998 through 2008, Jersey City issued building permits for 15,545 new residential housing.

While Newark and Jersey City show a drastic change in property tax burden, similar, though usually less dramatic, impacts can be seen in all of the Abbott communities²⁹. During the years from 1998-99 through 2005-06 most Abbott school districts were able to keep their school general fund tax levies no higher than in 1997-98, while their State aid and equalized valuations increased. Only in 2006-07 did the State begin to require a majority of the districts to raise more local taxes. School taxes in the urban districts “bottomed-out” about that time, and total tax rates

²⁷ Abbott v. Burke, IV, 149 N.J. 145.

²⁸ Salem City did not gain designation as an Abbott school district until 2004-05, but is included here as an urban community.

²⁹ Although the number of municipalities considered “urban” and, therefore, eligible for Abbott funding has fluctuated at times, all 31 that were ever considered in the category are included here as Abbott municipalities.

in these places are again on the rise but still, in most places, below their peaks in the early 1990's.

The Relative Importance of Determinants

Preceding sections describe the determinants of relative property tax burden among the 30 most heavily burdened places on a frequency basis. However, the relative importance of each determinant in the final Property Tax Burden Index of individual municipalities is not always apparent.

Property Tax Burden Profiles

The data base compiled to identify the significant determinants of property tax burden can be used to prepare an analysis of the determinants in any municipality. Table 8 shows the entries on an Excel spreadsheet that uses all 12 determinants to calculate a Property Tax Burden Index for any individual community. By changing each determinant for that municipality to the state average figure, one by one, while holding all other determinants constant, a municipality's Property Tax Burden Index can be recalculated to identify how much of a change can be attributed to that determinant. The accompanying flow chart reflects Table 8, and shows the way in which each determinant affects the calculation of the equalized net tax rate and the property tax as a percent of personal income.

Calculation of Property Tax Burden Profiles

Appendix 2 to this paper shows the value of each property tax burden determinant in 2008 for every municipality in the state³⁰. These can be inserted, one-by-one, in the Excel program outlined in Table 8, while holding all others constant, to prepare a Property Tax Burden Profile evaluating the effect of each determinant on that municipality.

³⁰ Except six; see FN5.

| AL – Property Tax Burden Index | SQRT(AE*AK) |

Patterns of Determinants in the Most Burdened Places

No single determinant explains the variation in property taxes within the state. Property Tax Burden Profiles have been calculated for the 30 most heavily burdened municipalities. Six different property tax burden determinants show up as the leading factor in the tax burden for at least one of these places (See Table 9), and an example is shown for each pattern.

For most of these communities, the principal cause of tax burden is the lack of an adequate tax base. Seventeen of the 30 municipalities, including the six most impacted places, have a low equalized valuation per capita as the single most important cause of their tax burden. Woodlynne (#1), with the highest 2008 Property Tax Burden Index in the state, is used as an example.

Five of the 30 most burdened communities have a relatively low level of State school aid as their leading cause of property tax burden. Here, West Orange (#7) is shown as an example.

Three municipalities in the group indicate low personal income as the principal reason for their high property tax burden. Haledon (#12) is an example of this group.

Three other places, all with Abbott school districts, have high school costs per pupil as the leading cause of their property tax burden. However, they also receive substantial amounts of State school aid that reduces their tax burden. Salem City (#3) is offered as an example.

A single municipality among the top 30 has a high municipal budget per capita as the most important determinant. The example shown is Hillside (#5)

Finally, one of the most burdened places has high county taxes per capita as its most important property tax determinant. This is the Township of Pohatcong (#26) in Warren County.

Table 9. Leading Property Tax Burden Determinants:
30 Most Heavily Burdened New Jersey Municipalities, 2008

| | Number | Municipalities | Property Tax Burden Profile Shown |
|---|--------|--|-----------------------------------|

| Low Budgeted School Surplus per Pupil | 4.93 | - 0.7 |
| <u>Determinants Reducing Tax Burden</u> | | |
| Low County Taxes per Capita | 6.06 | + 22.1% |
| Low Municipal Budget per Capita | 6.47 | + 30.2 |
| Low School Costs per Pupil | 7.44 | + 50.0 |
| High State School Aid per Pupil | 8.98 | + 80.8 |

Woodlynne

Woodlynne is a tiny residential borough (0.2 sq.mi.) on the border of the City of Camden. It was incorporated in 1901 from a portion of Haddon Township. The Borough has very limited financial resources, both of taxable property and of personal income. A changing population in recent decades – from white to African-American to Hispanic – has brought with it a very high public school enrollment as a percentage of the population, placing a special burden on community financial resources. Relatively little non-property-tax revenue is raised in this heavily residential community. State municipal aid helps only slightly to alleviate the tax burden

Both school costs per pupil and municipal budgets per capita are well below the state average, and the schools receive substantial amounts of State aid per pupil. The apportionment of county taxes based on equalized tax ratables is of considerable assistance to the Borough's taxpayers.

Property Tax Burden Profile

West Orange (Property Tax Burden Rank #7)

Actual 2008 Property Tax Burden Index: 4.21

| Determinants Changed to State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| Low State School Aid per Pupil | 3.48 | - 17.3% |
| High School Costs per Pupil | 3.81 | - 9.5 |
| High Municipal Budget per Capita | 3.88 | - 7.8 |
| High County Taxes per Capita | 4.04 | - 4.0 |
| Low Other Municipal Revenue per Capita | 4.08 | - 3.1 - |
| High School Enrollment % | 4.09 | - 2.9 |
| High % Residential Property | 4.13 | - 1.9 |
| Low Budgeted School Surplus per Pupil | 4.14 | - 1.7 |
| Low State Municipal Aid per Capita | 4.17 | - 1.0 |
| <u>Determinants Reducing Tax Burden</u> | | |
| High State Tax Rebates per Capita | 4.29 | + 1.9 % |
| High Equalized Valuation per Capita | 4.45 | + 5.7 |
| High Personal Income per Taxpayer Unit | 4.61 | + 8.7 |

West Orange

West Orange is a large suburban community in Essex County, combining older sections and newer developments. School factors play the largest role in the West Orange property tax burden, combining a below-average level of State school aid with above-average school costs per pupil. A high municipal budget per capita contributes to the tax burden. County taxes per capita, based on the substantial property tax base, are substantial. There is relatively little local municipal miscellaneous revenue. The high percentage of residential property, the below-average State municipal aid per capita, and low amounts of budgeted school surplus also contribute to the burden, though to a smaller degree.

Tax rebates per capita are slightly above average, but the main factors that moderate the tax burden in West Orange are the substantial property tax base and a considerable personal income per taxpayer unit.

Property Tax Burden Profile

Haledon (Property Tax Burden Rank #12)

Actual 2008 Property Tax Burden Index: 4.10

| Determinants Changed to State Average | Revised <u>Property Tax Burden Index</u> | Percentage Change <u>in Index</u> |
|--|---|---|
| <u>Determinants Causing High Tax Burden</u> | | |
| Low Personal Income per Taxpayer Unit | 3.04 | - 25.9% |
| Low Equalized Valuation per Capita | 3.09 | - 24.6 |
| High Municipal Budget per Capita | 3.83 | - 6.6 |
| Low State Municipal Aid per Capita | 3.93 | - 4.1 |
| High School Enrollment % | 3.94 | - 3.9 |
| High % Residential Property | 3.98 | - 2.9 |
| Low Budgeted School Surplus per Pupil | 4.03 | - 1.7 |
| <u>Determinants Reducing Tax Burden</u> | | |
| High State Tax Rebates per Capita | 4.12 | + 0.5 |
| Low County Taxes per Capita | 4.21 | + 2.7 |
| High State School Aid per Pupil | 4.26 | + 3.9 |
| High Other Municipal Revenue per Capita | 4.79 | + 16.8 |
| Low School Costs per Pupil | 4.91 | + 19.8 |

Haledon

Haledon is a small suburban community on the border of Paterson in Passaic County. Its financial resources are well below the state average, with low personal income per taxpayer unit being the most important tax burden determinant. Equalized valuation per capita is almost as low. Several other determinants contribute to the burden of the property tax, with a municipal budget per capita somewhat higher than average being the most important.

The two determinants that help to keep the property taxes from being more excessive are particularly low school costs per pupil and a substantial amount of local municipal miscellaneous revenue.

Salem City (Property Tax Burden Index Rank # 3)

Actual 2008 Property Tax Burden Index 4.40

| Determinants Changed To State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| High School Costs per Pupil | 1.97 | - 55.2% |
| Low Equalized Valuation per Capita | 2.30 | - 47.7 |
| Low Personal Income per Taxpayer Unit | 2.82 | - 35.9 |
| Low State Tax Rebates per Capita | 4.00 | - 9.1 |
| High School Enrollment % | 4.22 | - 4.1 |

| High State Municipal Aid per Capita | 4.70 | + 6.8 |
| Low Municipal Budget per Capita | 4.85 | + 10.2 |
| High Budgeted School Surplus per Pupil | 4.85 | + 10.2 |
| Low County Taxes per Capita | 4.88 | + 10.9 |
| High State School Aid per Pupil | 11.10 | +152.3 |

Salem City

Salem City, the urban center of rural Salem County was not one of the original Abbott communities, but was added to that list in 2004-05. As would be expected, Salem's leading property tax burden determinant is the high school costs per pupil mandated by the Abbott decision, but this is balanced by very substantial State school aid. Beyond this, Salem is a very poor community, and the low taxable property value and low personal income per capita and per taxpayer dominate its Property Tax Burden Index. A low level of State tax rebates per capita contributes to the tax burden.

Aside from high Abbott-based State school aid, other factors alleviating Salem's property tax burden are a low municipal budget, a substantial use of surplus in the school budget, and a relatively low levy for county services.

Hillside (Property Tax Burden Rank #5)

Actual 2008 Property Tax Burden Index 4.21

| Determinants Changed to State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| High Municipal Budget per Capita | 3.08 | - 26.8 % |
| Low Personal Income per Taxpayer Unit | 3.40 | - 19.2 |
| Low Equalized Valuation per Capita | 3.56 | - 15.4 |
| Low Budgeted School Surplus per Pupil | 4.10 | - 2.6 |

Determinants Reducing Tax Burden

| | | |
|---|------|-------|
| High % Residential Property | 4.26 | + 1.2 |
| High School Enrollment % | 4.27 | + 1.4 |
| High Other Municipal Revenue per Capita | 4.30 | + 2.1 |
| High State Municipal Aid per Capita | 4.33 | + 2.9 |
| High State Tax Rebates per Capita | 4.35 | + 3.3 |
| Low County Taxes per Capita | 4.39 | + 4.3 |
| Low School Costs per Pupil | 4.39 | + 4.3 |
| High State School Aid per Pupil | 4.42 | + 5.0 |

Hillside

Hillside is a medium-sized suburb in Union County, bordering the cities of Newark and Elizabeth. It is the only community among the 30 most heavily property-taxed municipalities where the leading cause of the burden is the high municipal budget. Contributing significantly to the tax burden are low levels of personal income and equalized valuation per capita.

A surprising number of different determinants have a favorable impact on Hillside's tax burden, but they are not substantial enough to offset the effect of the high municipal budget and the low financial resources of the community.

Property Tax Burden Profile

Pohatcong (Property Tax Burden Rank #26)

Actual 2008 Property Tax Burden Index 3.87

| Determinants Changed to State Average | Revised <u>Property Tax Burden Index</u> | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |

| High State Tax Rebates per Capita | 4.13 | + 6.7 |
| Low % Residential Property | 4.22 | + 9.0 |

Pohatcong

Pohatcong is a rural township in Warren County. No single determinant stands out as a dominant factor in the township's Property Tax Burden Profile. High county costs per capita have the largest impact, with low State school aid, a relatively high municipal budget per capita, and fairly low personal income as contributing factors.

Several determinants provide some property tax relief, including a low percentage of residential property, high State tax rebates per capita, and comparatively low school costs per pupil.

Patterns of Determinants in the Urban Communities

In the 31 urban municipalities there also is no single determinant that dominates the analysis of property tax burden. As would be expected, since the Abbott classification has been used to define the urban municipalities, high school costs per pupil stand out as the most important determinant in 16 places. Since these costs are balanced through court order with high levels of State school aid, it is useful to break this group of communities down by their second most important determinants. When this is done (See Table 10), ten of the 16 places have a low tax base – equalized valuation per capita – as the second most important property tax determinant. Vineland (#435) is shown as an example. Five places where high school costs are the leading determinant have low personal income as the secondary determinant; New Brunswick (#151) is an example. Finally, East Orange (#13) is the single example among the urban communities where high school costs are followed by a high municipal budget per capita as the second most important property tax burden determinant.

After high school costs, the most important determinant of property tax burden among the urban municipalities is a high municipal budget per capita. Seven of the 31 places follow this pattern, with Newark (#476) offered as the example.

Next in frequency among the urban places is a low equalized valuation per capita, which is found in four places; Bridgeton (#120) demonstrates this pattern.

Last, in four other communities, illustrated by Elizabeth (#268), low personal income per taxpayer and dependents is the most important determinant of property tax burden.

Table 10: Leading Property Tax Burden Determinants:
31 New Jersey Urban Municipalities; 2008

| Leading Property Tax Burden Determinant | Number | Secondary Property Tax Burden Determinant | Number | Municipalities | Property Tax Burden Profile Shown |

Property Tax Burden Profile

Vineland (Property Tax Burden Rank #435)

Actual 2008 Property Tax Burden Index 2.52

| Determinants Changed to State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| High School Costs per Pupil | 1.44 | - 42.6% |
| Low Equalized Valuation per Capita | 1.73 | - 31.1 |
| Low Personal Income per Taxpayer Unit | 1.92 | - 23.5 |
| High County Taxes per Capita | 2.15 | - 14.3 |
| Low State Municipal Aid per Capita | 2.42 | - 3.6 |
| High School Enrollment % | 2.45 | - 2.4 |
| Low State Tax Rebates per Capita | 2.49 | - 0.8 |
| <u>Determinants Reducing Tax Burden</u> | | |
| High Budgeted School Surplus per Pupil | 2.55 | + 1.6 |
| Low % Residential Property | 2.62 | + 4.4 |
| High Other Municipal Revenue per Capita | 2.70 | + 7.6 |
| Low Municipal Budget per Capita | 3.12 | + 24.3 |
| High State School Aid per Pupil | 6.03 | +140.2 |

Vineland

One of the largest municipalities in South Jersey, Vineland shows the typical Abbott pattern, with high school costs per pupil leading the determinants causing high property tax burden, and high State aid for schools alleviating that burden. Beyond these extremes, Vineland's tax burden can be attributed primarily to a low level of resources – a low equalized valuation per capita and limited personal income per taxpayer unit. County taxes also are a significant factor in Vineland's tax burden.

Aside from State school aid, a relatively low municipal budget per capita is significant in limiting Vineland's property tax burden.

Property Tax Burden Profile

New Brunswick (Property Tax Burden Rank #151)

Actual 2008 Property Tax Burden Index 3.29

| Determinants Changed to State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| High School Costs per Pupil | 1.43 | - 56.5% |
| Low Personal Income per Taxpayer Unit | 2.13 | - 35.3 |
| Low Equalized Valuation per Capita | 2.21 | - 32.8 |
| Low State Tax Rebates per Capita | 2.71 | - 17.6 |

| Low Budgeted School Surplus per Pupil | 3.25 | - 1.2 |
| <u>Determinants Reducing Tax Burden</u> | | |
| Low School Enrollment % | 3.38 | + 2.7 |
| High State Municipal Aid per Capita | 3.66 | + 11.2 |
| High Other Municipal Revenue per Capita | 3.69 | + 12.2 |
| Low % Residential Property | 3.84 | + 16.7 |
| Low County Taxes per Capita | 4.10 | + 24.6 |
| High State School Aid per Pupil | 7.34 | +123.1 |

New Brunswick

New Brunswick's Property Tax Burden Profile is typical of most urban districts which, by the convention used here, include all of the Abbott school districts. Heavy school costs per pupil constitute the largest property tax generator while, conversely, State school aid is the most important factor that reduces the tax burden. When these two determinants are set aside, deficiencies in resources – low personal income and limited equalized valuation per capita – are the two leading causes of property tax burden in the city. A fairly low level of State tax rebates per capita adds to the tax burden of the city's residents.

The city's tax burden is lightened by a relatively low county tax per capita, a below-average proportion of residential property, and relatively substantial amounts of municipal revenue from non-property tax sources. State municipal aid is of some assistance, but the remaining determinants have only minor impacts.

Property Tax Burden Profile

East Orange (Property Tax Burden Rank #13)

Actual 2008 Property Tax Burden Index 4.09

| Determinants Changed to State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| High School Costs per Pupil | 1.41 | - 65.6% |
| High Municipal Budget per Capita | 2.18 | - 46.8 |
| Low Equalized Valuation per Capita | 2.32 | - 43.4 |
| Low Personal Income per Taxpayer Unit | 2.80 | - 31.8 |
| Low State Tax Rebates per Capita | 3.65 | - 11.0 |
| Low Budgeted School Surplus per Pupil | 4.01 | - 2.2 |
| High % Residential Property | 4.03 | - 1.7 |
| <u>Determinants Reducing Tax Burden</u> | | |
| Low School Enrollment % | 4.12 | + 0.5 |
| High State Municipal Aid per Capita | 4.73 | + 15.4 |
| High Other Municipal Revenue per Capita | 4.87 | + 18.8 |
| Low County Taxes per Capita | 5.17 | + 26.1 |
| High State School Aid per Pupil | 10.53 | +156.8 |

East Orange

As an Abbott community, the large Essex County suburb of East Orange demonstrates the typical tax burden pattern of high school costs and high State school aid. Beyond this, the city's tax burden is most affected by its high municipal budget per capita and its lack of local financial resources—equalized valuation and personal income. A low level of State tax rebates per capita contributes to the city's tax burden.

On the other hand, the low county tax levy, due to the city's limited tax base, is of considerable assistance to East Orange, and above-average local non-property-tax municipal revenues and substantial State municipal aid also help the city.

Property Tax Burden Profile

Newark (Property Tax Burden Rank #476)

Actual 2008 Property Tax Burden Index 2.30

| Determinants Changed To State Average | Revised <u>Property Tax Burden Index</u> | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| High Municipal Budget per Capita | 0.00 | - 100.0% |
| High School Costs per Pupil | 0.53 | - 77.1 |
| Low Equalized Valuation per Capita | 1.47 | - 36.4 |
| Low Personal Income per Taxpayer Unit | 1.47 | - 36.4 |
| State Tax Rebates per Capita | 1.67 | - 27.8 |
| <u>Determinants Reducing Tax Burden</u> | | |
| Low School Enrollment % | 2.31 | 0 |
| High Budgeted School Surplus per Pupil | 2.34 | + 1.3 |
| High State Municipal Aid per Capita | 2.00 | + 21.2 |
| Low % Residential Property | 2.86 | + 23.8 |
| Low County Taxes per Capita | 3.04 | + 31.6 |
| High Other Municipal Revenue per Capita | 5.05 | + 118.6 |
| High State School Aid per Pupil | 6.95 | + 200.5 |

Newark

Newark, the state's largest city, has high per capita budgets for municipal purposes. If the city budgeted at the statewide average level and all other factors remained the same, there would be virtually no local property tax. Other determinants that increase the tax burden are the high costs of the schools, the low level of equalized valuation and personal income and limited State tax rebates per capita.

On the other hand, if Newark's state aid for schools were reduced to the state average amount per pupil, and all other determinants were kept constant, the city would have, by far, the highest property tax burden in the state. In actual fact, the availability of large amounts of State school aid in 2008 permitted the city to have both a high expenditure level per pupil and a high per capita municipal budget, while maintaining a relatively low property tax burden. Other factors that help to keep Newark's property taxes low include substantial amounts of non-property tax municipal revenue, the payment of a favorable share of county costs, a relatively low percentage of residential property, and significant amounts of State municipal aid.

Property Tax Burden Profile

Bridgeton (Property Tax Burden Rank #120)

Actual 2008 Property Tax Burden Index 3.36

| Determinants Changed To State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|
| <u>Determinants Causing High Tax Burden</u> | | |
| Equalized Valuation per Capita | 1.30 | - 61.3% |
| Personal Income per Taxpayer Unit | 1.86 | - 44.6 |
| School Costs per Pupil | 2.31 | - 31.3 |
| State Tax Rebates per Capita | 2.56 | - 23.8 |
| Other Municipal Revenue per Capita | 2.68 | - 20.2 |
| School Enrollment % | 3.23 | - 3.9 |
| <u>Determinants Reducing Tax Burden</u> | | |
| Budgeted School Surplus per Pupil | 3.37 | + 0.3 |
| State Municipal Aid | 3.52 | + 4.8 |
| % Residential Property | 3.55 | + 5.7 |
| County Taxes per Capita | 4.94 | + 47.0 |
| Municipal Budget per Capita | 6.07 | + 80.7 |
| State School Aid per Pupil | 13.24 | + 294.0 |

Bridgeton

Bridgeton is a very poor city, with much of its property tax burden attributable to the low equalized valuation per capita and limited personal income per taxpayer. High school costs per student also increase the city's property tax burden, but this is balanced by large amounts of State school aid per pupil. An unusually low receipt of State tax rebates contributes to the city's property tax burden, as does a lack of non-property tax municipal revenue.

Bridgeton's tax burden is alleviated by substantial amounts of State aid to the schools. A limited municipal budget per capita helps keep the tax burden down, as does a low level of county taxes per capita.

Property Tax Burden Profile

Elizabeth (Property Tax Burden Rank #268)

Actual 2008 property Tax Burden Index 3.02

| Determinants Changed to State Average | Revised Property Tax Burden Index | Percentage Change in Index |
|--|---|----------------------------------|

| Low Percentage Residential Property | 3.34 | + 10.6 |
| High Other Municipal Revenue per Capita | 3.35 | + 10.9 |
| Low County Taxes per Capita | 3.63 | + 20.2 |
| High State School Aid per Pupil | 6.75 | +123.5 |

Elizabeth

Elizabeth, the county seat and largest city in Union County, is an example of a municipality where low personal income and low property values are the two leading determinants of property tax burden, even out-ranking high Abbott school costs per pupil in importance. The city also has a high municipal budget per capita and receives a relatively modest amount of State tax rebates per capita.

More favorable determinants are the high per pupil amount of State school aid, the low county taxes per capita, a substantial amount of non-property-tax municipal revenue, and the comparatively low proportion of residential property.

Conclusion

While property taxes may be high throughout New Jersey, they are most burdensome in many of New Jersey's small suburban municipalities, which often have low levels of taxable property, and whose residents have limited personal incomes. Only rarely is the property tax burden in such places due to high levels of municipal or school spending.

Public officials in these communities must choose between providing only minimal services or imposing a high property tax. There is little that they can do within the context of their own municipalities and school districts; the solution must come from outside, through assistance from other sources. In recent years, court-directed increases in State aid to schools in the state's more urban communities have helped significantly to lower the property tax burden in those places. This also has happened to a lesser extent in non-urban communities. State municipal aid, however, has been much less important and has been distributed with less consideration of a community's own resources. State tax rebates have been of some help to individuals, but are not targeted to less affluent communities, and they have been distributed spasmodically.

One of the less-recognized determinants of property tax burden that is critical for many of the most-burdened places is the apportionment of county taxes on the basis of tax ratables. Without this policy, the property tax burden in the highest-tax communities would be far worse. A shift in responsibilities from municipalities to the county level would help the most burdened places – provided that the present method of apportioning county costs is continued.

The property tax in New Jersey is far from the monolithic monster often portrayed. It is complicated and diverse, having different impacts for different reasons throughout the state's many municipalities. In the aggregate, the property tax may be a huge mechanism for financing the state's local governments, but in its application to individual communities the property tax varies tremendously. A factor that causes high taxes in one place may be the salvation of another municipality. Too often, attempts to "solve the property tax problem" try to apply sweeping restrictions without identifying the different components of the "problem",
